                                             This invention relates to a viral vector constructed by the fusion of a viral protein with a ligand which binding specifically to the melanocyte-stimulating hormone (MSH) receptor. The vector contains one of four linkers represented by sequences AAA93815-A93818 and AAB25387-B23586, and DNA encoding a fibre protein selected from those represented by AAA93819-A93826 and AAB25387-B23594. The vector has cytostatic activity, and can be used for gene therapy and in the viagnosis and treatment of tumours, particularly malignant melanomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to compositions of modified soluble protein antigens capable of eliciting an enhanced in vivo cytotoxic T cell (CTL) response i.e. a major histocompatability complex (MHC) class I molecule response. The protein antigen is modified by the covalent addition of a peptide sequence which facilitate entry of the antigen into antigen presenting cells (APCs). The present sequence is one such peptide sequence which can be used to modify the soluble antigens. The present sequence is tandem pEA/ pK peptide conjugate. The modified antigen composition may be used for immunising against, or treating a tumour e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                            Virus vector useful in diagnosis and treatment of tumors particularly malignant melanoma, constructed by fusing viral protein with ligand binding specifically to melanocyte-stimulating hormone receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2000-549414/50.

                                                                                                                              This invention relates to a viral vector constructed by the fusion of a viral protein with a ligand which binding specifically to the melanocyte-stimulating hormone (MSH) receptor. The vector contains one of four linkers represented by sequences AAA93815-A93818 and AAB23583-B23586, and DNA encoding a fibre protein selected from those represented by AAA93819-A93826 and AAB23587-B23594. The vector has cytostatic activity, and can be used for gene therapy and in the diagnosis and treatment of tumours, particularly malignant melanomas. The present sequence represents a modified fibre protein used in the construction of the vector.

                                                                                                                                                                                                                                                                  This invention relates to a viral vector constructed by the fusion of viral protein with a ligand which binding specifically to the melanocyte-stimulating hormone (MSH) receptor. The vector contains one of four linkers represented by sequences AAA93815-A93818 and AAB23583-B23586, and DNA encoding a fibre protein selected from those represented by AAA93819-A93826 and AAB23587-B23594. The vector has cytostatic activity, and can be used for gene therapy and in the diagnosis and treatment of tumours, particularly malignant melanomas. present sequence represents a modified fibre protein used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence data for this patent did not form specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10151), expressed DNA sequences (ABL101840-ABL10151) and the encoded proteins (ABB57737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
diagnosing and treating e.g.
                                                                                                                                                                                                                                                                                         28-FEB-2000;

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating

The present invention relates to the isolation of novel DNA-binding proteins, and cDNA (AAS29030-AAS29157) and genomic sequences encoding for these proteins. DNA-binding proteins such as histones, chromo (chromatin organisation modifier) domain proteins, and y-box binding proteins may contribute to diseases resulting from aberrant DNA organisation and/or gene transcription. The sequences of the invention are useful in screening assays to identify antagonists and/or agonists that may enhance or block activities mediated by DNA-binding proteins. Blockers of DNA-binding proteins may be useful in treating disorders such as malignant diseases (e.g. cancer), autoimmune disorders (e.g. diabetes mellitus), rheumatic diseases (e.g. rheumatoid arthritis), genetic abnormalities (e.g. cystic fibrosis), infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   17-NOV-2000

                            polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating insign of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications of the polypeptide and polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    proteins.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diseases (e.g. HIV) and neurological disorders (e.g. Alzheimer's disease). The polynucleotide sequences of the invention may also be used in gene therapy. AAU18154-AAU18281 represent novel DNA-binding
                                                                                                                                                                                                                                                                                                                  Claim 20; SEQ ID No 57077; 103pp; English
                                                                                                                                                                                                                                                                                                                                                           biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB;

                      The present invention relates to compositions of modified soluble protein antigens capable of eliciting an enhanced in vivo cytotoxic T cell (CTL) response i.e. a major histocompatability complex (MHC) class I molecule response. The protein antigen is modified by the covalent addition of a peptide sequence which facilitate entry of the antigen into antigen presenting cells (APCs). The present sequence is one such peptide sequence which can be used to modify the soluble antigens. The present sequence is peptide pEA. The modified antigen composition may be used for immunising against, or treating a tumour e.g. prostate and breast carcinoma or multiple myeloma, or pathogen in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and to produce other types of data and products dependent on I amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the specification, but was obtained in electronic format directly at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                  Antigens modified by the covalent addition of a peptide that facilitates entry into antigen presenting cells, useful for compositions for immunizing against tumors and pathogens -

                                                                                                                                    The present invention relates to a transporter system for delivering CC nucleic acid to a cell. The system comprises a nucleic acid binding CC complex, consisting of a binding molecule bonded non-covalently to the CC nucleic acid, and covalently to a surface ligand, and a lytic agent. The CC binding molecule is spermine or a spermidine derivative. Nucleotide CC sequences AAA36633-A36652 and peptide sequences AAY98456-Y98500 are used in the construction of the transporter system of the invention. The CC transporter system is used in gene therapy, particularly to deliver CC nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g CC for treating cardiovascular disease, cancer, and infection. The CC transporter systems are also used to create transgenic animals (as models include transforming cells to produce proteins, or transfecting cells in CC vitro to study the function of the nucleic acid. The use of a surface CC ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular cc interior, from endosomes, without requiring endosomal or lysosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 1

                                                                                                                                                                                                                                                                                                                                 The invention relates to a nucleic acid transport system (NTS) for CC delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; CC (b) a moiety that recognizes and binds to a cell surface receptor or CC antigen or is capable of entering a cell through cytosis; (c) a nucleic cacid or macromolecular molecule binding molety; (d) a molety that is CC capable of moving or initiating movement through a nuclear membrane; and/CC or (e) a lysis molety that enables the transport of the entire complex CC from the cell surface directly into the cytoplasm of the cell. The NTS CC delivers nucleic acid into the cellular interior as well as the nucleus of specific nucleic acid accordingly. The NTS can also be used to create CC transgenic animals for assessing human disease, such as cancer, in an CC animal model. The NTS can be used in vitro with tissue culture cells complex complex the role of various nucleic acids to be studied by targeting complex in the transport with the contraction of the cells. The NTS can be used to create the contraction of the cells and the contraction of the cells capable of various nucleic acids to be studied by targeting contraction into specifically targeted tissue culture cells. The CC lysis agent within the NTS avoids the problem of endosomal/lysosomal contractions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents the nuclear ligand, #2, used in a nucleic acid transporter system. The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells.

to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid. The nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, applipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor suppressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-DEC-1993;

                                                                                                                                                                                                                                                                                                             The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine. Cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, insunnomodulatory activity and activity in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

RESULT 11

JO1154
hemagglutinin precursor - influenza A virus (strain A/goose/Hong Kong/10/76) (fragment)
N;Contains: hemagglutinin HA1; hemagglutinin HA2
C;Species: influenza A virus
C;Date: 31-Mar-1992 #sequence_revision 31-Mar-1992 #text_change 20-Jun-2000
C;Accession: JO1154
R;Yasuda, J; Shortridge, K.F; Shimizu, Y; Kida, H.
J. Gen. Virol. 72, 2007-2010, 1991
A;Title: Molecular evidence for a role of domestic ducks in the introduction of avian H3
A;Reference number: JO1153; MUID:91341491
A;Accession: JO1154
A;Molecule type: genomic RNA
A;Residues: 1-550 <YAS>
A;Cross-references: GB:D00930; NID:9221273; PIDN:BAA00770.1; PID:9221274
A;Note: the authors translated the codon GGG for residue 218 as Glu
A;Note: residues 528-532 are not shown in this publication
C;Superfamily: influenza virus hemagglutinin
C;Keywords: glycoprotein; homotrimer
F;1-328/Product: hemagglutinin HA1 #status predicted <HA1>
F;330-545/Product: hemagglutinin HA2 #status predicted <HA1>
F;8,22,38,165,285,483/Binding site: carbobydrate (Asn) (covalent) #status predicted
                                                                                                                                            hemagglutinin precursor - influenza A virus (strain A/duck/Hong Kong/64/76) (fragment)

hemagglutinin precursor - influenza A virus (strain A/Mem/102/72)

N.Contains: hemagglutinin HA1; hemagglutinin HA2

C;Species: influenza A virus

C;Date: 19-May-1994 #sequence_revision 19-May-1994 #text_change 31-Mar-2000

C;Accession: A94441; A04051

R;Sleigh, M.J; Both, G.W.; Brownlee, G.G.; Bender, V.J.; Moss, B.A.
in Structure and Variation in Influenza Virus, Laver, G., and Air, G., eds., pp.69-79, E
A;Title: The haemagglutinin gene of influenza A virus: nucleotide sequence analysis of C
A;Reference number: A94441
A;Accession: A9445
A;Residues: 1-566 (SLE)
C;Superfamily: influenza virus hemagglutinin
C;Keywords: hemagglutinin; homotrimer; lipoprotein; thiolester bond
F;11-16/Domain: signal sequence #status predicted <HAl>
F;346-566/Product: hemagglutinin HA2 #status predicted <HAl>
F;355,562,565/Binding site: palmitate (Cys) (covalent) #status predicted

- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VICELL RECEPTORS AND FOR INITIATING INFECTION.

- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO (HAI AND HA2) LINKED BY A DISULFIDE BOND.

- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.
                                                                                                                                                     IAZH3

Fleury D., Wharton S.A., Skehel J.J., Knossow M., Bizebard T.;

"Antigen distortion allows influenza virus to escape neutralization

Nat. Struct. Biol. 5:119-123(198).

-i- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS

CELL RECEPTORS AND FOR INITIATING INFECTION.

-i- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAI

(HAI AND HAZ) LINKED BY A DISULETED BOND.

-i- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.
                                                                                                                                                                                                                                                           MEDLINE-94352388; PubMed-8072525; Bullough P.A., Hughson F.M., Skehel J.J., "Structure of influenza haemagglutinin at Nature 371:37-43(1994).

Okuno Y., Isegawa Y., Sasao F., Ueda S.;

"A common neutralizing epitope conserved between the hemagglutinins of influenza a virus H1 and H2 strains.";

J. Virol. 67.2552-2558(1993).

-I- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VIRUS TO CELL RECEPTORS AND FOR INITIATING INPECTION (BY SIMILARITY).

-I- SUBUNIT: HOMOTRIMER. EACH OF THE MONOMERS IS FORMED BY TWO CHAINS (HAL AND HAZ) LINKED BY A DISULFIDE BOND (BY SIMILARITY).
